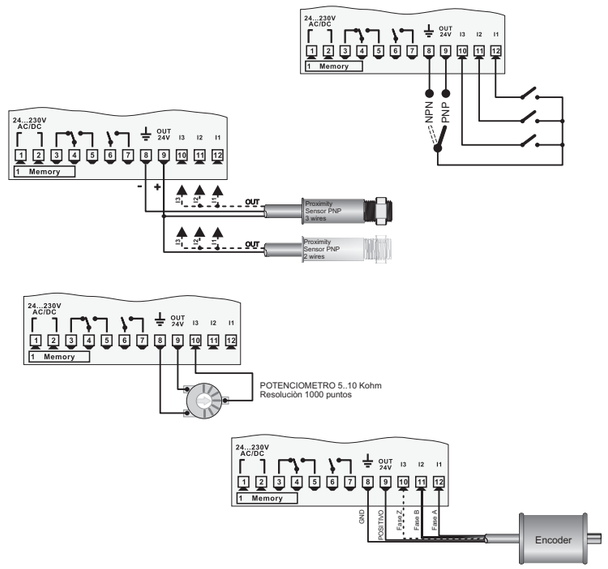
INTRODUCCION

Gracias por haber escogido un dispositivo Pixsys.

El Contador TCT101 es ejecutable en 2 diferentes modalidades; Simple o Doble contador, todos con impostaciòn independiente.
Estan disponibles 3 entradas digitales universales (NPN/PNP/Contacto limpio) utilizables para la lectura de encoder bidireccionales, o funciòn de conteo Up, conteo Down, inversiòn del conteo, Lock y Hold para el bloque y el mantenimiento de la visualizaciòn corriente; una de las entradas es tambien analogica para la variaciòn de uno de los setpoint en modalidad favorable con un potenciometro externo.

ESQUEMA DE CONEXION



Potenciometro:

Para variar Set1 o Set2 con el potenciometro externo ejecutar las siguientes instrucciones:

1- utilizar potenciometros de 5kohm a 10kohm como valor de fondo escala.

2- conectar el cursor al morseto I3; una conexiòn errada puede comprometer las caracteristicas del potenciometro, el instrumento en cambio irà en protecciòn temperatura.

3- la resoluciòn de la entrada es de maximo 1000 puntos; configurar los parametros "Upper limit" e "Lower limit" con diferencias de maximo 1000 unidades.
(Ej.: Lo.S.1 a 50,0 y uP.S.1 a 150,0 para variar el tiempo colegado al Set1 entre 50 y 150 segundos con pasos de un decimo). Diferencias superiores dan instable la cifra menos significativa.

4- Para calibrar el potenciometro entrar en configuraciòn y seleccionar:
H.in.3 en **Pot.** **F.in.3** en **Set1** o **Set2** **P.tAr.** en **En.**
a la salida de la configuraciòn posicionar el potenciometro en el valor de minimo y oprimir el botòn (down), posicionar el potenciometro en el valor de maximo y oprimir el botòn (up), automaticamente se sale de la procedura de calibraciòn.

MEMORY CARD (opcional)

Es posible duplicar parametros de un instrumento a otro mediante el uso de la Memory Card. Estan previstas dos modalidades:

> Con controlador conectado a la alimentaciòn:

Inserir la Memory Card con controlador apagado.

Al encendido el display 1 visualiza MEM y el display 2 visualiza ----

(Solo si en la Memory estas registrados valori correctos).

Oprimiendo el botòn (UP) el display 2 visualiza LOAD

Confirmar con el botòn (FNC) .

El instrumento carga los nuevos valores y vuelve a arranc

> Con controlador no conectado a la alimentaciòn:

La memory card està dotada de bateria interna con autonomia para almenos 1000 usos. Inserir la memory card y oprimir el botòn de programaciòn.

Durante la escritura de los parametros el led se enciende rojo, al termine de la procedura se enciende verde. Es posible repetir la procedura sin particulares atenciones.

⚠ **ACTUALIZACION MEMORY CARD.**

Para actualizar los valores de las Memory seguir el procedimiento descrito en la primera modalidad, impostando ---- en el display 2 en modo de no cargar los parametros en el controlador.

Entrar en configuraciòn y **variar almenos un parametro**.

Saliendo de la configuraciòn el salvataje serà automatico.

CARGA VALORES DE DEFAULT (restablecimiento impostaciones de fabrica)

	OPRIMIR	EFECTO	EJECUTA
1	FNC por 3 segundos	En el display 1 aparece 0000 con la 1°cifra titilante,mientras en el display 2 aparece PASS	
2	o	Se modifica la cifra, la cifra titilante se passa a la sucesiva con el botòn SET	Inserir password 9999
3	SET para confirma	El instrumento carga las impostaciones de fabrica	Apagar y re-encender el instrumento

MODIFICA PARAMETRO DE CONFIGURACION

	OPRIMIR	EFECTO	EJECUTA
1	FNC por 3 segundos	En el display 1 aparece 0000 con la 1°cifra titilante,mientras en el display 2 aparece PASS	
2	o	Se modifica la cifra, la cifra titilante se pasa a la sucesiva con el botòn SET	Inserir password 1234
3	SET per conferma	El display visualiza el primer parametro de la tabla de configuraciòn FUNC	
4	o	Recorre los parametros	
5	SET + o	Se incrementa o decrementa el valor visualizado oprimiendo antes SET y contemporaneamente un botòn flecha	Inserire il nuovo dato che verrà salvato al rilascio dei tasti
6	FNC	Final de la configuraciòn, el controlador sale de la programaciòn

INTRODUCTION

Thanks for choosing a Pixsys device. Counter TCT201 can be set in 2 different modes: Single or Double counter, all with independent setting. 3 universal digital inputs are available (NPN/PNP/Potential free contact) and can be used for bidirectional encoders reading, or Up/Down count function, count inversion, Lock/ Hold to lock or hold current visualization. One input is also analogue in order to allow setpoint modification by an external potentiometer.

⚠

Read carefully the safety guidelines and programming instructions contained in this manual before using/connecting the device. Disconnect power supply before proceeding to hardware settings or electrical wirings. Only qualified personnel should be allowed to use the device and/or service it and in accordance to technical data and environmental conditions listed in this manual. Do not dispose electric tools together with household waste materials in observance of European Directive 2002/96/CE

Potentiometer:

To modify Set1 or Set2 by external potentiometer follow the steps below:

1- use potentiometers 5kOhm to 10kohm

2- connect cursor to pin I3; a wrong connection may damage the potentiometer and lead to lock of the device.

3- accuracy on input is max 1000 points, therefore set the parameters "Upper limit" and "Lower limit" with a max difference of 1000 units.
(Ex.: LoS1 to 50,0 and uPS1 to 150,0 to modify time value related to Set1 between 50 and 150 seconds with steps of one tenth). Greater differences would make unstable the less significant digit.

4- To calibrate the scale of potentiometer enter the configuration mode and select:
Hin.3 as Pot Fin.3 as Set1 or Set2 P.tAr as Enable
Exit configuration mode and place potentiometer at minimum level and press key, then place potentiometer at max level and press premere key: the device automatically exit the calibration procedure.
N.B.: A switch-off of the device would interrupt the calibration.

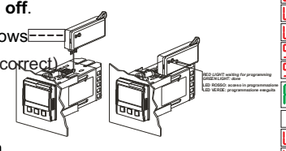
MEMORY CARD (optional)

Parameters and setpoint values can be copied from one device to another using the Memory car.

There are two methods:

> With the device connected to the power supply
insert the memory card **when the controller is off**.

On activation display 1 shows and display 2 shows ----
(Only if the values stored on Mmeory Card are correct)



By pressing the key display 2 shows LoAd

Confirm using the key .

The device loads the new data and starts again.

> With the controller disconnected from the power supply:

The memory card is equipped with an internal battery with a life of about 1000 uses.

Insert the memory card and press the programming button.

When writing the parameters, the LED turns red and on completing the procedure it changes to green. It is possible to repeat the procedure.

⚠ **UPDATING MEMORY CARD.**

To *update* the memory card values, follow the procedure described in the first method, setting display 2 to ---- so as not to load the parameters on controller.

Enter configuration and **change at least one parameter**.
Exit configuration. Changes are saved automatically.

LOADING DEFAULT VALUES

	PRESS	DISPLAY	DO
1	SET for 3 seconds	Display 1 shows 0000 with 1°digit blinking, while Display 2 shows PASS	
2	Or	Modifies blinking digit and pass to the next one pressing	Enter password 9999
3	to confirm	Device loads default values	Switch the device off and restart it

MODIFY CONFIGURATION PARAMETERS

	PRESS	DISPLAY	DO
1	SET for 3 seconds	Display 1 shows 0000 with first digit blinking, while Display 2 shows PASS	
2	or	Modifies blinking digit and pass to the next one pressing	Enter password 1234
3	to confirm	Display shows first parameter of configuration table Func	
4	or	Scroll paremeters	
5	+ or	Increase or decrease visualized value pressing and an arrow key	Enter the new data that will be saved when releasing arrow key
6	+	End configuration, controller exits from programming mode

INTRODUCTION

Thanks for choosing a Pixsys device. TCT101-4ABC-T can be set in 3 different modes: **timer**, **counter** or **tachometer**. 3 universal digital inputs are availables (NPN/PNP/Potential free contact) and can be used for reading external switches, proximity sensors and bidirectional encoders. One input is also analogue in order to allow setpoint modification by external potentiometer. Rs485 serial interface allows communication via Modbus RTU protocol.

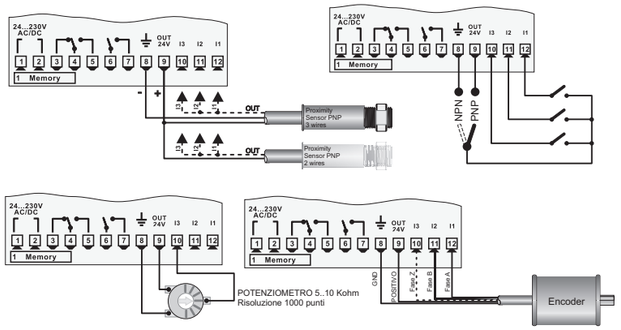
Read carefully the safety guidelines and programming instructions contained in this manual before using/connecting the device.

Disconnect power supply before proceeding to hardware settings or electrical wirings.

Only qualified personnel should be allowed to use the device and/or service it and in accordance to technical data and environmental conditions listed in this manual.

Do not dispose electric tools together with household waste materials in observance of European Directive 2002/96/CE

WIRING DIAGRAM



Potentiometer:
To modify Set1 or Set2 by external potentiometer follow the steps below:
1- use potentiometers 5kOhm to 10kohm
2- connect cursor to pin I3; a wrong connection may damage the potentiometer and lead to lock of the device.
3- accuracy on input is max 1000 points, therefore set the parameters "Upper limit" and "Lower limit" with a max difference of 1000 units.
(Ex.: LoS1 to 50,0 and uPS1 to 150,0 to modify time value related to Set1 between 50 and 150 seconds with steps of one tenth). Greater differences would make unstable the less significant digit.
4- To calibrate the scale of potentiometer enter the configuration mode and select:
Hin.3 as Pot Fin.3 as Set1 or Set2 P.tAr as Enable
Exit configuration mode and place potentiometer at minimum level and press key, then place potentiometer at max level and press premere key: the device automatically exit the calibration procedure.
N.B.: A switch-off of the device would interrupt the calibration.

MEMORY CARD (optional)

Parameters and setpoint values can be copied from one device to another using the Memory car.

There are two methods:

> With the device connected to the power supply
insert the memory card **when the controller is off**.

On activation display 1 shows and display 2 shows ----

(Only if the values stored on Mmeory Card are correct).

By pressing the key display 2 shows LoAd

Confirm using the key .

The device loads the new data and starts again.

> With the controller disconnected from the power supply:

The memory card is equipped with an internal battery with a life of about 1000 uses.

Insert the memory card and press the programming button.

When writing the parameters, the LED turns red and on completing the procedure it changes to green. It is possible to repeat the procedure.

⚠ **UPDATING MEMORY CARD.**

To *update* the memory card values, follow the procedure described in the first method, setting display 2 to ---- so as not to load the parameters on controller.

Enter configuration and **change at least one parameter**.
Exit configuration. Changes are saved automatically.

2	or	Modify blinking digit and pass to the next one pressing SET	Enter password 1234
3	SET to confirm	Display visualizes the first parameter of configuration table Func	
4	or	Scroll parameters	
5	SET + or	Increase or decrease visualized parameter pressing SET and an arrow key	Enter new data that will be saved when releasing keys
6	FNC	End configuration, controller exits from configuration	

PARAMETERS LIST

TCT101-4ABC-T allows to select operating mode, modifying first configuration parameter. According to chosen mode, only the relevant parameters will be displayed.
Refer to technical notes of each mode to find parameters list.

SERIAL COMMUNICATION

TCT101-4ABC-T is provided with RS485 serial and can receive / transmit data via MODBUS RTU protocol. Device can be configured only as Slave. This function allows to control multiple controllers connected to a supervisory system (Master).
Each instrument will answer to a Master query only if it contains some addresses as on parameter SLAd (Slave Address).
Allowed addresses range are from 1 to 254 and there should not be controllers with the same address on the same line.
Address 255 can be used by the Master to communicate with all connected equipments (all connected devices will answer Master query with this address), while with 0 all devices receive command, but no answer is expected (broadcast mode).
TCT101-4ABC-T can introduce an answer delay (in milliseconds) to Master request. This delay has to be set on parameter SEdE (Serial Delay).
At each parameter modification, instrument stores values in EEPROM memory (100000 writing cycles).
NB: Modifications made to Word different to those described in the following table can lead to instrument malfunction.

MODBUS RTU PROTOCOL MAIN FEATURES

Baudrate	Selectable by parameter
Format	8,N,1 (8 bit data, no parity, 1 stop bit)
Supported functions	WORD READING (0x03, 0x04) (max 20 word) SINGLE WORD WRITING (0x06) MULTIPLE WORDS WRITING (0x10) (max 20 word)
Read/Write	RO Read Only WO Write Only RW Read / Write
Reset Value	? Data unknown at reset EEPROM Value stored on EEPROM Valore Value indicated at reset

`E-04`	INCORRECT CALIBRATION DATA (Note 6)
`E-05`	INCORRECT STATUS DATA (Note 6)
`E-06`	INCORRECT BACKUP REGISTERS (Note 7)

Note 6: SWITCH THE DEVICE OFF AND RESTART IT; IF ERROR IS STILL NOTIFIED, CONTACT TECHNICAL SERVICE.
Note 7: DISCHARGED BATTERY. KEEP THE DEVICE CONNECTED TO THE POWER SUPPLY IN ORDER TO RECHARGE THE BATTERY.

⚠

In PWM mode, selection of parameters 16 `Fo.S.1` and 17 `Fo.S2` (SET1 and SET2) is limited at `SSSS` (seconds).
Min. and Max. SET1 limit (lied to working percentage or Duty Cycle) is limited into a range from 0 to 100 (%).

Note 1: In this timer functioning, if P-06 Active State Input 1 = Rising Edge or P-09 Function Input 1 = Disabled, at count end (reaching of set), timer automatically STOP.
Note 2: This function doesn't reset timer value and needs an input for the reset.
Note 3: This function resets timer at STOP.
Note 4: This function resets timer at START.
Note 5: This function is active only if P-06 Active State Input 1 = Rising Edge

EnAb Always enable	TACHOMETER OUTPUTS ARE ALWAYS ENABLED.
Auto Automatic enable	DEPENDING ON LOGIC OUTPUT MODE PARAMETER, THERE ARE DIFFERENT OPERATING MODES: - **High Deviation** : OUTPUTS ARE ALWAYS ENABLED - **Low Deviation** : AT STARTING, OUTPUTS ARE DESABLED; THEY CAN BE ENABLED WHEN TACHOMETER VALUE OVERCOMES SETPOINT VALUE AND KEPT ENABLED UNTIL INPUT SIGNAL FALLS BELOW VALUE SET ON PARAMETER «MINIMUM INPUT FREQUENCY» (P-14); - **Inside Band** : OUTPUTS ARE ALAWAYS ENABLED - **Out of Band** : AT STARTING OUTPUTS ARE DESABLED, THEY CAN BE ENABLED WHEN TACHOMETER VALUE OVERCOMES SET1-SET2 VALUE, AND KEPT UTNITL INPUT SIGNAL FREQUENCY FALLS BELOW VALUE SET ON PARAMETER «MINIMUM INPUT FREQUENCY» (P-14);
inP Enable by input	TACHOMETER OUTPUTS ARE ENABLED TO OPERATE ONLY IF: - INPUT 2 FUNCTION IS SET ON **OUT ENABLE/DISABLE** AND INPUT IS ACTIVE - INPUT 3 FUNCTION IS SET ON **Out Enable/Disable** AND INPUT IS ACTIVE
